

EMPOROS

A local Cepheus campaign workstation

Human referee No AI required	AI-assisted referee Private desktop help	AI referee Your MCP client runs scenes
--	--	--

What Emporos handles

Characters and careers, ships, sectors and maps, travel and jumps, trade and finance, encounters and combat, campaign journals, uploaded adventures, and persistent keyed locations.

Emporos keeps mechanics and game state in PostgreSQL. AI is optional and is used chiefly as a referee or assistant through a local MCP connection. No model API key is entered into Emporos.

Produced by Raymond Williams

Install on Windows

You need GitHub Desktop, Python 3.11 or newer, and PostgreSQL. The game is cloned from GitHub and runs only on your computer.

1 Install the three prerequisites

Install **GitHub Desktop**, **Python 3.11+**, and **PostgreSQL**. Keep the PostgreSQL password you choose.

2 Clone Emporos

In GitHub Desktop choose **File - Clone repository - URL**, then use:

`https://github.com/Diogenes187/Emporos.git`

Stay on the **main** branch.

3 Create the database

Open pgAdmin and create an empty PostgreSQL database named **emporos**.

4 Create your private configuration

In the Emporos folder, copy **.env.example** and rename the copy **.env**. Edit its database connection. A typical first line is:

```
postgresql://postgres:YOUR_PASSWORD@localhost:5432/emporos
```

5 Install Python requirements once

Open PowerShell in the Emporos folder and run:

```
python -m pip install -r requirements.txt
```

Keep .env private. It contains your local database password and is intentionally excluded from GitHub.

Launch and begin playing

1 Start Emporos

Double-click **Start Emporos.bat**. It applies database updates, starts the local server, and opens `http://127.0.0.1:8765/`.

2 Create a campaign

Choose a campaign name, referee mode, and starting setting. **Ledger Reach** is the included original setting; you may instead generate or import a sector, or begin uncharted.

3 Create characters

Use the dedicated Character Creation page. Roll and rearrange characteristics, enter careers, survive terms, gain training and rank, muster out, then name and finish the character.

4 Build the campaign

Use Crew, Ship, Sector, Trade, Operations, Encounters, Journal, and Library for their own jobs. The database records mechanical results; the referee supplies judgment and narration.

5 Stop cleanly

Double-click **Stop Emporos.bat** when finished.

Updating

Double-click **Update Emporos.bat**. It safely stops the server, obtains the newest main-branch version, refreshes requirements, updates the database, and reopens the game. It refuses to overwrite local code changes. Campaign data and `.env` remain local.

Trying an uploaded adventure

Open **Library**, upload a PDF or TXT adventure, and complete its private source review. Create a linked adventure workspace and begin reviewed indexing. A connected AI must account for every verified page before proposing keyed locations. Exact source quotations accompany each draft, and only the human referee can approve a draft into the playable key.

Optional desktop AI connection

Emporos does not buy or call AI services. Connect an MCP-capable desktop client such as ChatGPT, Claude, or SillyTavern. Your client controls the model, subscription, memory, and cost.

Connect it

Start Emporos, open the **Information** page, and copy the MCP configuration shown there into your desktop client. The displayed paths are generated for your own installation. Restart or reconnect the client, then ask:

```
Call emporos_status and tell me whether the local game is connected.
```

Useful first requests

Campaign overview	List my Emporos campaigns, then summarize the current campaign state.
AI referee	Check pending referee turns, use only Emporos mechanics for outcomes, and return concise narration.
Adventure indexing	Show the adventure indexing status. Read every required page before proposing cited location drafts.
Captain's Log	Archive this conversation in the current campaign Captain's Log.

The safety boundary

The connected AI cannot issue arbitrary SQL. It receives defined MCP tools, deterministic engine commands, and receipts. Uploaded adventure drafts remain proposals until human approval, and current room state overrides stale module text.

Keep .env private. It contains your local database password and is intentionally excluded from GitHub.

Support and updates

Project: github.com/Diogenes187/Emporos

For updates, use **Update Emporos.bat** rather than downloading a fresh copy over your campaign folder.
